S@T Manager

Complementary Companion for CardLogix S@T Solution

The S@T Manager tool offers users a method to easily create S@T scenarios through a user-friendly interface. S@TML files can be easily configured, converted into S@T byte code, and loaded onto S@T-enabled SIM cards. This functionality can be used for CardLogix's Delos™ native OS SIMs and Java SIM S@T cards.

The tool is not commercially available but is publicly presented as an internal enabling tool. CardLogix's expert S@T team is here to help our partners move to a commercial deployment of S@T. Content can be customized according to what operators want to offer to their customers. More information about collaboration with CardLogix can be found by contacting your sales representative.
