

CardLogix Biometric Enrollment Software

CLX Enroll Biometrics, by CardLogix, is an application allowing operators to easily and quickly enroll individual signature, biometric (fingerprints, face and iris) and personal information to a secure database or directly to a secure credential like an ID.

Our enrollment form (Fig 1) includes over 48 of the most common fields used for identity enrollment and management. You can customize the enrollment form (Fig 2) and, if required, CardLogix can customize, add or change the fields as requested.

This software saves the enrollment data into an XML file or to a cloud base database. It can be viewed through a database (like Access or Excel) or send directly to an issuance application, like the Card Encoding Engine (CEE) by CardLogix for an instant secure smart card issuance.

The biometric information is captured and formatted with the most advance biometric algorithm. Each new enrollment is automatically verified biometrically through our AFIS (Automatic Fingerprint Identification System) and ABIS (Automatic Biometric Identification System) for any duplicate biometric information so no users can be entered twice regardless of the personal data that is entered (Fig 3 & Fig 4).

Our application is ready to be deployed as is, but can be customized as per your requirements. Our CLX Enroll Biometrics is fully compatible with the BIOSID system for mobile enrollment, verification and instant biometric validation. Any users can be validated through either system.

Features and benefits

- Easy to use and ready to be deployed
- Easy to customize (add or remove fields)
- ICAO picture standard template
- Designed to work with the Card Encoding Engine (CEE) software
- Reporting functionality included with printing of each records
- Able to import fields to expedite enrollment
- Signature field allows for instant signature for the enrollee
- Export of all user information into a local or cloud database
- The software is available in English, Spanish, French, German & Arabic
- Biometric information (Fingerprints (FAP20, 30 or FAP60), Iris & Face)
- All user information is easily searchable
- AFIS & ABIS capability is standard through our biometric template advance system
- Most advance biometric template from Neurotechnology, Princeton Identity and Rank One Computing
- Required hardware (Windows PC, Camera (Face and Iris Biometric capability), signature pad, and tripod) and provided by CardLogix with the IDBX Biometric solution
